

# EXAM 1

Math 212, 2016-2017 Fall, Clark Bray.

You have 50 minutes.

No notes, no books, no calculators.

YOU MUST SHOW ALL WORK AND EXPLAIN ALL REASONING  
TO RECEIVE CREDIT. CLARITY WILL BE CONSIDERED IN GRADING.

All answers must be simplified. All of the policies and guidelines  
on the class webpages are in effect on this exam.

Good luck!

Name \_\_\_\_\_

“I have adhered to the Duke Community  
Standard in completing this  
examination.”

1. \_\_\_\_\_

2. \_\_\_\_\_

3. \_\_\_\_\_

4. \_\_\_\_\_

5. \_\_\_\_\_

Signature: \_\_\_\_\_

Total Score \_\_\_\_\_ (/100 points)

1. (20 pts) The cross product  $\vec{a} \times \vec{b}$  is the vector  $(2, 1, 3)$ .

(a) Compute the area of the parallelogram defined by  $\vec{a}$  and  $\vec{b}$ .

(b) Compute the volume of the parallelepiped defined by  $\vec{a}$ ,  $\vec{b}$ , and  $\vec{c} = (1, -5, 2)$ .

(c) Is the list  $\vec{b}$ ,  $\vec{c}$ ,  $\vec{a}$  in right-hand order or left-hand order?

(d) Find the equation of the plane parallel to  $\vec{a}$  and  $\vec{b}$  that passes through the point  $(1, 1, 1)$ .

2. (20 pts) The velocity of the parametric curve  $\vec{x}(t)$  is given by  $\vec{v}(t) = (2\sin(3t), 4e^{2t})$ , and a momentary position is  $\vec{x}(0) = (4, 5)$ .

(a) Find the position  $\vec{x}(2)$ .

(b) Find the acceleration and the curvature at time  $t = 0$ .

3. (20 pts) The surface  $S$  has equation  $x^3 - 2y^2 - 3z = 12$ .

(a) Can  $S$  be viewed as a graph of some function  $f : \mathbb{R}^a \rightarrow \mathbb{R}^b$ ? If so, identify  $a$ ,  $b$ , and the formula for evaluating the function  $f$ .

(b) Can  $S$  be viewed as a level set of some function  $g : \mathbb{R}^c \rightarrow \mathbb{R}^d$ ? If so, identify  $c$ ,  $d$ , and the formula for evaluating the function  $g$ .

(c) Is the parametric curve  $\vec{x}(t) = (-t^2, t^3, -t^6 - 4)$  contained in  $S$ ?

4. (20 pts) Does the limit below exist? If it does, compute the value; if it does not, show that it does not.

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2y^3 - 5xy^4}{x^4 + 2x^2y^2 + y^4}$$

5. (20 pts) We have  $w = w(p, q)$ ,  $p = ab$ , and  $q = 2a + 3b$ . Use the chain rule to write a fully simplified expression for  $\frac{\partial^2 w}{\partial a \partial b}$ .
