## EXAM 3

## Math 212, 2023 Summer Term 2, Clark Bray.

Name: $\qquad$ Section: $\qquad$ Student ID: $\qquad$

## GENERAL RULES

YOU MUST SHOW ALL WORK AND EXPLAIN ALL REASONING TO RECEIVE CREDIT. CLARITY WILL BE CONSIDERED IN GRADING.

No notes, no books, no calculators.
All answers must be reasonably simplified.
All of the policies and guidelines on the class webpages are in effect on this exam.

## WRITING RULES

Do not remove the staple, tear pages out of the staple, or tamper with the exam packet in any way. Do not write anything near the staple - this may be cut off.

Use black pen only. You may use a pencil for initial sketches of diagrams, but the final sketch must be drawn over in black pen and you must wipe all erasure residue from the paper.

Work for a given question can be done ONLY on the front or back of the page the question is written on. Room for scratch work is available on the back of this cover page, and on the two blank pages at the end of this packet; scratch work will NOT be graded.

## DUKE COMMUNITY STANDARD STATEMENT

"I have adhered to the Duke Community Standard in completing this examination."

Signature: $\qquad$
(Scratch space. Nothing on this page will be graded!)

1. (20 pts) The curve $I$ is the intersection of the cylinder $x^{2}+z^{2}=1$ with the plane $y=z$. The curve $C$ is the portion of $I$ with $x \geq 0$, oriented downward. The vector field $F$ is defined by $\vec{F}(x, y, z)=\left(e^{z^{2}}, z e^{y}, 2 x z e^{z^{2}}+e^{y}\right)$. Compute $\int_{C} \vec{F} \cdot d \vec{x}$.
(extra space for questions from other side)
2. (20 pts) The surface $S$ is the portion of $z=x^{2}$ over the rectangle $R=[0,1] \times[1,2]$ in the $x y$ plane, oriented in the positive $x$-direction. The vector field $\vec{F}$ is defined by $\vec{F}(x, y, z)=(0,1, z)$. Compute $\iint_{S} \vec{F} \cdot d \vec{S}$.
(extra space for questions from other side)
3. (20 pts) The surface $S$ has equation $x^{2}+4 y^{2}+9 z^{2}=36$, and at $(0,-3,0)$ we have $\vec{n}=(0,1,0)$. Compute the flux through $S$ of the vector field $\vec{F}(x, y, z)=\left(x^{2}-e^{z}, x-4 y+\sin z, x^{3} y^{3}-4\right)$.
(extra space for questions from other side)
4. (20 pts)
(a) The curve $C$ is parametrized by $\vec{x}(t)=(\cos t, \sin t, \cos t-3 \sin t)$. Compute the line integral along $C$ of the vector field $\vec{F}=\left(x^{3}+z, x-e^{y^{3}}, 4 y+\sin \left(z^{3}\right)\right)$. (Hint: Find two familiar equations that the parametrization satisfies.)
(b) In $\mathbb{R}^{2}$, we have the vector field $\vec{F}(x, y)=\left(-y^{3}, x^{3}\right)$. A very small circle $C$ of known radius $a$, oriented counterclockwise, can be placed with its center at any point $\vec{c}=\left(x_{0}, y_{0}\right)$. Use Green's theorem and an approximation to find the point $\vec{c}$ that will minimize the circulation $\int_{C} \vec{F} \cdot d \vec{x}$.
(extra space for questions from other side)
5. (20 pts) The surface $S$ is the portion of $z=\left(x^{2}+y^{2}-1\right)\left(e^{x y}\right)$ that is below the $x y$-plane, oriented downward. Compute the flux through $S$ of the vector field $\vec{F}(x, y, z)=\left(3 x z^{2}+z e^{z}, x, 3+x-z^{3}\right)$.
